New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 13; Page 80; 149pp; English

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGRR-3). (I) have cytostatic, hepatorropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,

(I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antiidabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VBGFR-3 such as cancer, e.g. brain, lung,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel polynuclectide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynuclectide of the invention may have a use in gene therapy. The polynuclectide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADC85549-ADC87617 represent GPCR's of the invention.
                          pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemanglomas and diabetes. The present sequence represents a VEGFR-3 binding peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide, useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; GPCR; guanosine triphosphate-binding protein coupled receptor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method of selecting target and target binder pairs comprising mixing in a reaction vessel phage expressing biological targets and phage expressing target binders, each having distinguishable selection markers and selecting target and target binder pairs based on the selection markers. The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related Tiel-binder peptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                            New polypeptides, useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, or for regulating or preventing an antibody response.
                                                                                                                                                                                                                                                                                               The invention relates to novel isolated polypeptides comprising a sequence that binds an immunoglobulin Fc region. The polypeptides are useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, e.g. blood, plasma or transgenic milk. The Fc-region binding polypeptides are also useful for regulating or preventing an antibody response, or for increasing the half-life and over all stability of a therapeutic or diagnostic compound that is administered to or enters the circulatory system of an individual. This sequence represents an Fc region binding
Immunoglobulin Fc region; binding; whole blood; plasma; transgenic milk;
antibody response; half-life; stability; circulatory system.

The invention relates to a method of evaluating sample by providing a soluble serum protein (I), one or more compounds physically associated with (I), and a (I)-binding agent that comprises a peptide that especifically binds to (I), allowing the (I)-binding agent to bind to (I) to form a complex including one or more compounds physically associated with (I), separating the complex from one or more components of the sample, and evaluating one or more of the physically associated compounds. The sample comprises blood or serum, or is obtained from a biopsy. The sample may also be obtained from a tumour or a region within 5 mm of a tumour. The method is useful for detecting modulators that modulate interaction of serum protein-binding compound and serum protein sequence represents a serum albumin-binding peptide identified using the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
Evaluating sample comprising soluble serum protein by forming complex comprising serum protein and physically associated compounds using peptide ligand that specifically binds with proteins, which is separated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              respiratory; cytostatic; antiarthritic; antiinflammatory; gastrointestinal; antibacterial; immunosuppressive; antidiabetic; antirheumatic; gene therapy; molecular weight marker; chromosome marker; chromosome tag; genetic fingerprinting; nutritional supplement; cancer; inflammatory condition; arthritis; inflammatory bowel disease; crohn's disease; sepsis; rheumatoid arthritis; diabetes mellitus type 1; graft versus host disease; human; expressed sequence tag; EST.

The present invention describes an isolated polymuclectide (I): (a)

comprising a nuclectide sequence selected from SEQ ID NO:1-244; or (b)

which encodes a polypeptide with biological activity, where the

polymuclectide hybridises to (I) under stringent hybridisation conditions

or has greater than 99% sequence identity with (I). (I) has respiratory,

cytostatic, antiarthritic, antiinflammatory, gastrointestinal,

cytostatic, antiarthritic, antiinflammatory, gastrointestinal,

cytostatic, antiarthritic, antiinflammatory, gastrointestinal,

cytostatic, and can be used in gene therapy. (I) can be used for

generating polymucleotides encoding chimeric or fusion proteins and

cativities, and can be used in gene therapy. (I) can be used to

generating polymucleotides encoding chimeric or fusion proteins and

cativities, and can be used in which the corresponding protein is

preferroinally expressed; as molecular weight markers on gels; as

chromosome markers or tags to identify chromosomes or to map related gene

continons; to compare with endogenous DNA sequences or to map related gene

continons; to compare with endogenous DNA sequences in patients to

dentify potential genetic disorders; as probe to subtract-out known

con genes, related DNA sequences; as probe to subtract-out known

sequences in the process of discovering other novel polymucleotides; for

selecting and making oligeners for attachment to a gene chip or other

compositions and polypeptides can also be used as nutritional sources

con supplements, e.g. as a protein or amino acid supplement, as a carbon

source, as a nitrogen source or as a source of carbohydrates. The

polymucleotides and polypeptides can also be used as nutritional

confostitions are useful for promoting better or faster calceur. The

compositions are useful for promoting better or faster closure of nor

healing wounds, for the generation and regeneration of tissues, for generation withing relative or faster closure of proverser.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reperfusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease or Crohn's disease), sepsis, rheumatorid arthritis, diabetes mellitus type 1 or graft versus host disease. The present sequence represents an expressed sequence tag (EST) derived amino acid sequence from the present
cancer, lung or liver fibrosis, arthritis, inflammatory bowel disease,
Crohn's disease, rheumatoid arthritis, diabetes mellitus type 1 or graft
versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention. N.B. The sequences for this patent were obtained from the USPTO web site from an equivalent US patent US20040048249A1.

The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are antagonists of the insulin-like growth factor (IGP-1) receptor are useful for treating insulin-like growth factor (IGP-1) receptor are useful for treating insulin-like growth factor (IGP-1) receptor treating insulin-like growth factor (IGP-1) receptor are useful for treating neurological diseases, including stroke and diabetic neuropsthy. The peptides are also useful in therapeutics and research reagents. ANU88034-AAU90957 represent IR and/or IGP-1 receptor-binding peptides and related amino acid sequences of the
                                                                                                                                                                                                                                                                                              Modulating insulin activity in mammalian cells, for treating e.g. diabetes and tumors, comprises using peptides that bind to insulin or insulin-like growth factor receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention describes novel cDNA sequences (A) highly expressed in normal uterine tissue which can have anticancer and cytostatic activity and can be used for gene therapy. (A) are used (1) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTB (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTB from different libraries may represent different parts of the same curknown gene, distorting the estimated frequency of cocurrence in a particular tissue. ANYS9838-X5983 represent protein fragments encoded by the human uterine tissue derived CDNA fragments represented in AAZ41325-New nucleic acid sequences expressed in normal uterine tissues, and derived polypeptides, for treatment of uterine cancer and identification Antisense; prokaryotic essential gene; cell proliferation; drug design. ы Н Zyskind JW; Xu HH; Gaps Dahl ö Schmitt A, Pilarsky C, 62.5%; Score 45; DB 2; Length 129; 62.5%; Pred. the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid conciding a polypeptide whose expression is inhibited by the antisense conciding a polypeptide whose expression is inhibited by the antisense conciding a polypeptide whose expression is inhibited by the antisense contisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the contisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway concluded for the gene product or that has an activity against a biological pathway concluded for proliferation or that inhibits cellular proliferation; (8) identifying a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling the extent organism; or (11) identifying the target of a compound that inhibits the proliferation of an organism. The attisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, concluding discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, concludent dincettyly from MIPO at the printed specification, but was obtained for the print of the printed specification, but was obtained for the print of the printed specification, but with any or the same according the concluding the concluding and proper security of the printed specification, but with any or the same according the same according the same according the same according the same accor 1; New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. The invention relates to an isolated nucleic acid comprising any one of Low density lipoprotein receptor binding protein; signal transduction; LDL receptor binding protein; LDL receptor signalling pathway.                                                                                                                                                                                                                                                                                                                                                                                                                         02-MAY-2
                                                                                                                                                                                                                                                                                                                                                                                      18-APR-2
  The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) receptor binding protein (I) with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) with circumparts of the stress, the system provides an unbiased interaction of (I) and (II), and detecting the stress-biased interaction of (I) and (II), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from of (I) and (II), where a difference between BI and UI indicates that the stress alters that interaction of (I) in selected from channel brain 3, Mintl, ICAP-1 and APC subunit 10. The method is useful for detecting a stress that alters functional interaction of LDL receptor binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating signal transduction through LDL receptors ABB04778 to ABB04909 represent LDL receptor binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                            ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; B7-H1.2 protein; Butryophilin 2/3 protein; transplant rejection; immunological condition; graft-versus-host disease; allergy; asthma; inflammatory bowel disease; sepsis; Alzheimer's disease; atherosclerosis; T-cell mediated inflammation; autoimmune disease; multiple sclerosis; systemic lupus erythematosus; autoimmune demyelination; Grave's disease; psoriasis; autoimmune diabetes; diabetic neuropathy; HIV infection; rheumatoid arthritis; human immunodeficiency virus; immunosuppressive; gene therapy; infection; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to B7-H1.2 or Butryophilin 2/3 polypeptides of human B7 polypeptide family and polymucleotides encoding such proteins. Sequences of the invention are useful for treating an immunological conditions (e.g., transplant rejection, graft-versus-host disease, allergy, asthma, inflammatory bowel disease, seppis), diseases that are caused or exacerbated by T-cell mediated inflammation (e.g., Alzheimer's disease or atherosclerosis), autoimmune diseases (e.g., systemic lupus erythematosus, autoimmune diseases (disease, psoriasis, multiple sclerosis, autoimmune diabetes, diabetic neuropathy, theumatoid arthritis), bacterial or viral infections end and immunodeficiency virus (HIV) infection, delayed reconstitution of T-cells, defects in T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New B7-H1.2 or Butryophilin 2/3 polypeptide of the human B7 polypeptide family, useful for treating an immunological condition e.g. transplant rejection.
encoding a polypeptide which is believed to be cytostatic, antifinatiflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                          Gaps

C The invention relates to an isolated cytoplasmic, nuclear, membrane bound or secreted polypeptide, designated NOVX (actually NOVI, 2a, 2b, 3a, 3b, 4 5a, 5b, 5c, 5d, 5e, 5f, 5g, 5h, 5i, 6, 7 and 8), a variant of NOVX, at multiple of the mature form of NOVX. Also included are a polynuclectide encoding NOVX (or its complement), a vector comprising the polynuclectide, a cell comprising the vector, an anti-NOVX antibody, determining the presence of NOVX polynuclectide in a sample using the antibody of etermining the presence of NOVX polynuclectide in a sample using the process of NOVX polynuclectide in a sample using the nutibody. CC determining the presence of NOVX polynuclectide in a sample using a probe which binds to NOVX polynuclectide, in the polynuclectide and the antibody are useful for diagnosing, treating or preventing a NOVX.

CC antibody are useful for diagnosing, treating or preventing a NOVX. Cantibody are useful for diagnosing, treating or preventing a NOVX. Cantibody are useful for diagnosing, treating or preventing a NOVX. Cantibody are useful for diagnosing, treating or preventing a NOVX. Cantibody are useful for diagnosing, treating or preventing a NOVX. Cantibody are useful insignal processing and metabolic pathway modulation, inflammation, autoimmune disorders, selected from cardiomyopathy, attrose, Lesch-Nyhan graducerative and neuropsychiatric disorders, hypertension, wound has partingent disease, spreamic lapsace, Alzhaimer's disorders, hypertension, wound hearing, observe and neuropsychiatric disorders, hypertension, wound consumed the antibody are useful in screening assays, consumptioning clinical trials and pharmacogenomic), and in methods of treatment (e.g., chromosomal mapping, tissue tryping, forensic biology), consumed to modulate and antagonist compounds, and as bait proceductive medictine (e.g., diagnosetic assays) prognostic assays, conserved the presented of the presented of the presented of the produce antibodies immunospecific for NOVX, as vaccines to recent for potential agon membrane bound The invention relates to an isolated cytoplasmic, nuclear,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 13; Page 80; 149pp; English.

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,

(I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,

(I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, marrow or blood, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

The invention comprises a method (BRASIL - Biopanning and Rapid Analysis of Selective Interactive Ligands) to obtain a targeting peptide. The BRASIL method of the invention involves: exposing a target to a phage display library in a first phase; exposing the first phase to a second phase; and separating the phage bound to the target from unbound phage. The BRASIL method of the invention allows cell phages to be separated from the remaining unbound phage in a single differential centrifugation method shows a significant increase in recovery of specific phage and a substantial decrease in background. The BRASIL method is useful for method shown as a significant increase in recovery of specific phage and a substantial decrease in background. The BRASIL method is useful for method of the invention are useful for tracting peptides identified by the method of the invention are useful for treating disease states, such as diseases; bacterial infection; viral infection; cardiovascular disease and
                             pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemanjomas and diabetes. The present sequence represents a VEGFR-3 binding peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BRASIL; targeting peptide; bacterial infection; biopanning and Rapid Analysis of Selective Interactive Ligands; diabetes; inflammatory arthritis; atheroscalerosis; cancer; autoimmune disease; viral infection; cardiovascular disease; degenerative disease

The invention comprises a method (BRASIL - Biopanning and Rapid Analysis of Selective Interactive Ligands) to obtain a targeting peptide. The BRASIL method of the invention involves: exposing a target to a phage display library in a first phase; exposing the first phase to a second phase; and separating the phase; exposing the first phase to a second from the BRASIL method of the invention allows cell phages to be separated from the remaining unbound phage in a single differential centrifugation step. When compared to conventional cell panning methods, the BRASIL method shows a significant increase in recovery of specific phage and substantial decrease in background. The BRASIL method is useful for identifying targeting peptides. The targeting peptides identified by the method of the invention are useful for treating disease states, such as: diabetes; inflammatory arthritis; atherosclerosis; cancer; autoimmune disease; bacterial infection; viral infection; cardiovascular disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                      diabetes;

                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a method (BRASIL - Biopanning and Rapid Analysis of Selective Interactive Ligands) to obtain a targeting peptide. The BRASIL method of the invention involves: exposing a target to a phage chase; and separating the phase; exposing the first phase to a gecond phase; and separating the phase bound to the target from unbound phage. The BRASIL method of the invention allows cell phases to be separated from the remaining unbound phage in a single differential centrifugation step. When compared to conventional cell panning methods, the BRASIL method shows a significant increase in recovery of specific phage and a substantial decrease in background. The BRASIL method is useful for identifying targeting peptides. The targeting peptides identified by the method of the invention are useful for treating disease states, such as: diabetes; inflammatory arthritis; atherosclerosis; cancer; autoimmune disease; bacterial infection; viral infection; cardiovascular disease and construction of the invention of the second of sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

The invention comprises a method (BRASIL - Biopanning and Rapid Analysis of Selective Interactive Ligands) to obtain a targeting peptide. The BRASIL method of the invention involves: exposing a target to a phage display library in a first phase; exposing the first phase to a second phase; and separating the phage bound to the target from unbound phage. The BRASIL method of the invention allows cell phases to be separated from the remaining unbound phage in a single differential centrifugation step. When compared to conventional cell panning methods, the BRASIL method shows a significant increase in recovery of specific phage and a substantial decrease in background. The BRASIL method is useful for identifying targeting peptides in recovery of specific phage and a decrease; inflammatory arthritis; atherosclerosis; cancer; autoimmune disease; hacterial infection; viral infection; cardiovascular disease and degenerative disease. The present maino acid sequence represents a rargeting peptide of the invention
                                                                                                                            BRASIL; targeting peptide; bacterial infection; Biopanning and Rapid Analysis of Selective Interactive Ligands; diabetes; inflammatory arthritis; atherosclerosis; cancer; autoimmune disease; viral infection; cardiovascular disease; degenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identification of targeting peptides that can be used to treat diseases e.g. cancer and arthritis, by the BRASIL (Biopanning and Rapid Analysis of Selective Ligands) method comprises a single differential centrifugation step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

(I) and extrostatic, hepatotropic, antiinflammatory, hypotensive, antiidabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases. The present sequence chronic hepatitis, haemangloms and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                     Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis, vascular endothelial growth factor; cytostatic; hepartorropic; antiinflammatory; hypotensive; antiidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a method for incorporating 18F radionuclide into peptide-containing peptides with cansaining peptides with a fadiolabeling thiol-concaining peptides with cansaining peptides with cluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIR2-(CH2)n-X, or a comparated alkene in which at least one of the two double bonded carbon atoms beast at least one leaving group comprising I. Br. Cl. azide, cosylate, mesylate, nosylate, nosylate, mesylate, mesylate, nosylate, in mesolate, maleimide (optionally substituted by 1-2 alkyl) or 3-sulfomaleimide; Rl. Cl. azide, tosylate, mesylate, nosylate, triflate, mlending comprision of the sulfomic acid, tertiary ammonium, alkyl (optionally substituted by COOH, OH, sulfomic acid, tertiary ammonium, alkyl or gusternary ammonium, coox, COOH, OH, sulfomic acid, tertiary ammine or characternary ammonium, alkyl or phenyl: The method is used for Radiolabeling peptide-containing targeting vectors such as proteins, antibodies, antibody fragments and receptor-targeted peptides for use in routine clinical positron enission congraphy. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0314-716 represent caramples of F-18 labeled peptides in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antiidabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oscophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, the present sequence chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific cartibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targetling methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method
                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "acetylated; modified with free amino acid group, protected amino acid group, chelating agent or a metal-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating cancer and metabolic diseases by administering a multi-specific antibody having a targeting arm that binds to an antigen and a capture arm that binds to a polymer conjugate comprising a therapeutic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of diagnosing or treating a disease or disorder. The method involves administering to a tissue a multi-specific antibody (I) or antibody fragment, comprising a targeting arm that binds to an antigen on the target site, and a capture arm that binds to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Optionally Cysteinyl; if Cys the residue is methylated; N-terminal acetylated."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to targeting an agent towards a target site in a tissue, comprising administering to the tissue, a multi-specific antibody or its fragment, comprising a targeting arm that binds to an antigen of the target site and a capture arm that binds to a polymer conjugate, and administering a polymer conjugate that binds to the capture arm, the conjugate has a polymer conjugate to the agent such as therapeutic agent, a peptide, an enzyme and a labelled ligand. Also included is a kit useful for targeting a target site within a tissue in a subject or tissue sample comprising the above mentioned multi-specific antibody or its fragment and a polymer conjugate. The method is used for targeting an agent towards a target site in a tissue (e.g. a tumour). The method is also useful for therapputic or diagnostic purposes and further in photodynamic therapy. The present sequence is an immunogenic peptide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Targeting an agent towards a target site in a tissue, by administering in a tissue, a multi-specific antibody or its fragment and a polymer conjugate that binds to the capture arm of the multi-specific antibody.
                                                                                                                                                                                                                                                                                             peptide; multi-specific antibody; polymer conjugate; tumour; photodynamic therapy.

The solid tunour is calced hyphatic leukaenias, and multiple myeloma. The solid tunour is calcosen melanoma, carcinoma dyreferably renal carcinoma, lung carcinoma, intestinal carcinoma and stement carcinoma, of carcinoma, lung carcinoma, intestinal carcinoma is chosen from infarts. Carcinoma, lung carcinoma, intestinal carcinoma is chosen from infarts. Clot, embolus, atheroselercit plaque and ischaenia. The metabolic disease or disorder is amyloidosis, where the antibody binds amyloid. The disease or disorder is displaced or ectopic normal tissue the nethod can be used for normal tissue. The classes or disorder is displaced or ectopic normal tissue chosen from endometrium, thymus, splean and parathyroid. The method can be used for normal tissue the disease or disorder is an autoimmume disease such as muntoimmume disease or disorder is an autoimmume disease such as muntoimmume disease or disorder is displaced or ectopic normal tissue is chosen from bone marrow and splem. The upon sephritis, rhupus erythemacous, and rhematod attritis, cluss ill autoimmume diseases such as immune—mediated thrombocytopenia gravis, upons erythemacous, and paperhicis, systemic lugas and choracytopenia systemic lugas solutions. Systemia systemia synticme, thrombocytopenia erythemacous, maltiple erythemacous, systemia militiple erythemacous, systemia purpura, post-trombocytopenic purpura and choracytopenia synthemacous, systemia synthemacous, systemia, erythemacous, systemia, sy polymer conjugate, and administering to the tissue a polymer conjugate that binds to the capture arm, the polymer conjugate comprising a polymer conjugated to a diagnostic or therapeutic agent. Also included is a conjugated to a diagnostic or therapeutic agent. Also included is a dethod for photodynamic diagnosis or treatment of a disease or disorder; or intravascular or endoscopic method for diagnosing or treating a disease or disorder. The method is useful for diagnosing or treating a disease or disorder chosen from cancer (oseophageal, gastric, colonic, rectal, pancreatic, lung, breast, ovarian, urinary bladder, endometrial, cervical, testicular, renal, adrenal and liver cancer, solid tumour, B-cervical, testicular, renal, adrenal and liver cancer, solid tumour, B-cell malignancy or T-cell malignancy is catiovascular lesion; an infectious disease, neurodegenerative disease; metabolic disease; and an infectious disease. The B-cell malignancy is chosen from indolent forms of B-cell lymphomas, acute lymphatic leukaemias, and multiple myeloma. production transportant transpo

```
The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, comprising a modulating agent comprising a deemosomal cadherin cell adhesion recognition CAR sequence (ABB45314-ABB47262), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polymorlocide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence or analogue. The modulating agents have immunosuppressive, cytostatic and antiapoptotic activity and are used to facilitate wound healing and/or reduce scar tissue, for enhancing adhesion of foreign tissue implants (e.g. skin graft or organ implant), treating an autoimmune blistering disorder and to treat cancer (e.g. carcinoma, leukaemia or melanoma) and induce apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion; comprising a modulating agent comprising a desmosomal cadherin cell adhesion recognition CAR sequence (ABB45314-ABB47562), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polynucleotide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence or analogue. The modulating agents have immunosuppressive, cytostatic and antiapoptotic activity and are used to facilitate wound healing and/or reduce scar tissue, for enhancing adhesion of foreign tissue implants (e.g. skin graft or organ implant), treating an autoimmune blistering disorder and to treat cancer (e.g. carcinoma, leukaemia or melanoma) and induce apoptosis
                                                                                                                                                                    Desmosomal cadherin; cell adhesion; CAR sequence; immunosuppressive; cytostatic; antiapoptotic; wound healing; reduce scar tissue; skin graft; organ implant; autoimmune blistering disorder; cancer; apoptosis; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, useful for facilitating wound healing and/or reducing scar tissue, treating cancer and inducing apoptosis.
                                                                                                                                 Desmocollin-1 CAR cyclic peptide 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gour BJ;

Sequence 4 Application US/08239765C

Retent No. 669228

GENERAL INFORMATION:

APPLICANT: Savakis, Charalambos

APPLICANT: Loukeris, Athanasios

TITLE OF INVENTION: Bukaryctic Transposable Element

FILE REFERENCE: 18747/1130

CURRENT APPLICATION NUMBER: US/08/239,765C

CURRENT FILING DATE: 1994-05-09

PRIOR FILING DATE: 1992-09-14

NUMBER OF SEQ ID NOS: 6

SOFTWARE: Patentin version 3.1

LENGTH: 5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W19-09-572-404B-1454

Sequence 1454, Application US/09572404B

Sequence 1454, Application US/09572404B

PUBLICATION NO. US20030078374A1

GENERAL INFORMATION:

APPLICANT: Proteom Ltd

TITLE OF INVENTION: Complementary peptide ligands from the human genome

FILE REFERENCE: Human patent

CURRENT APPLICATION NUMBER: US/09/572,404B

CURRENT PILING DATE: 2000-05-17

NUMBER OF SEQ ID NOS: 4203

SOFTWARE: ProtPatent version 1.0
